SMJ Manuscript 20-22646:

Do tenure-based voting rights help mitigate the family firm control-growth dilemma?

Claudia Imperatore and Peter F. Pope

Online Appendix

This document includes the results for the various tests we discuss in the *Supplementary tests* section or those mentioned in the footnotes of the manuscript.

All variables are as defined in the paper with the following additions:

| Other CEM Count variable ranging from 0 to 2 capturing the number of CEMs implemented by the firm in addition to TVRs (i.e. presence of non- voting preferred shares and shareholder agreement) Firstborn Indicator variable equal to 1 if family owner has a male firstborn child, and 0 otherwise Proceeds from equity Net proceeds from sale of common and preferred stock, as reported in firms' cash flow statements, deflated by lagged total assets Median Tobin's Q Industry-year median value of Tobin's Q Tobin's Q Ratio of the market value of assets to total assets. The market value of assets is defined as the book value of total assets plus market equity minus common equity. Market equity is defined as shares outstanding times the fiscal year closing price Cash dividends/Sales Cash dividends paid scaled by total sales % Minority directors Number of minority directors sitting on the board of directors over board size Log(Free float) Natural logarithm of firm's free float (as reported in Refinitiv Eikon) Financial constraints computed according to Whited and Wu (2006) as [(-0.091 x CF) - (0.062 Positive dividends) + (0.021 x TLTD) - (0.044 x log(Total Assets) + (0.102 x Industry Sales Growth) - (0.035 x Sales Growth)], where CF is cash from operations divided by total assets, Positive dividends is a dummy that equals 1 if the firm pays cash dividends and zero otherwise, TLTD is long-term debt over total assets, and Industry Sales Growth is 2 digits ICB industry sales growth average PPE Property, plant, and, equipment (net) divided | | | | | |

This table presents the results from examining the impact of TVR adoption on family firms' investment depending on whether TVRs are vested or not. The sample consists of Italian-listed non-financial firms for the period 2015-2019. A constant term is included, but not reported. All

This table presents the results from the first step instrumental variable estimate from the Stata etregress command. The TVR adoption indicator is regressed on *Firstborn* and a set of control variables. The sample consists of Italian-listed non-financial firms for the period 2015-2019. A constant term is included, but not reported. All variables are defined in this Appendix or the manuscript. Robust standard errors are reported in parentheses.

This table examines the moderating role of family board influence on the relation between TVR adoption and investment in family firms. Column 1 reports the findings when neither the CEO nor the Chairperson belong to the family, while Column 2 shows the results when the CEO and/or the Chairperson belong to the family. Columns 3 and 4 present the results when the percentage of board members (excluding the CEO and Chairperson) who belong to the family is below and above the sample mean, respectively. The sample consists of Italian-listed non-financial firms for the period 2015-2019. A constant term is included, but not reported. All variables are defined in this Appendix or the manuscript. Robust standard errors are reported in parentheses

This table presents the results from examining the impact of TVR adoption on family firms' investment after applying an entropy balance procedure to match family firms with TVRs with other firms before the actual TVR adoption. The sample consists of Italian-listed non-financial firms for the period 2015-2019. A constant term is included, but not reported. All variables are defined in this Appendix or the manuscript. Robust standard errors are reported in parentheses.
